Regional Development**

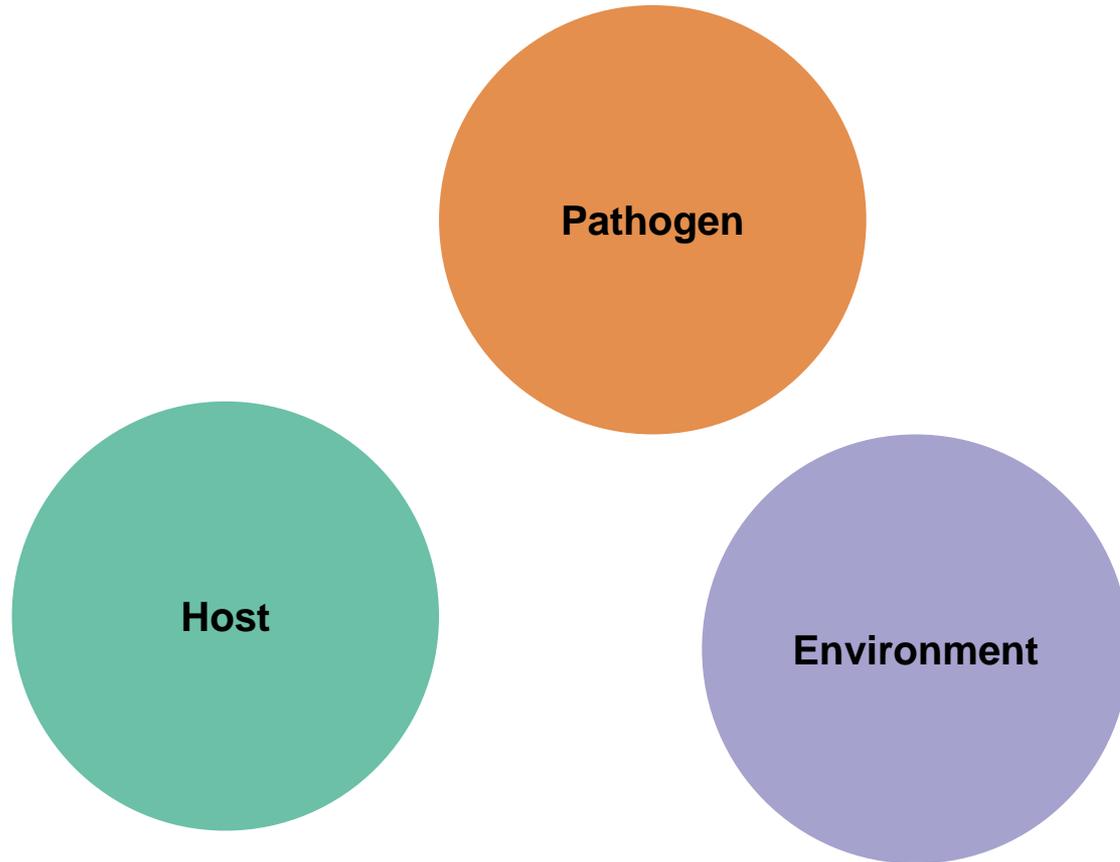

Concepts and Principles for Disease Modelling

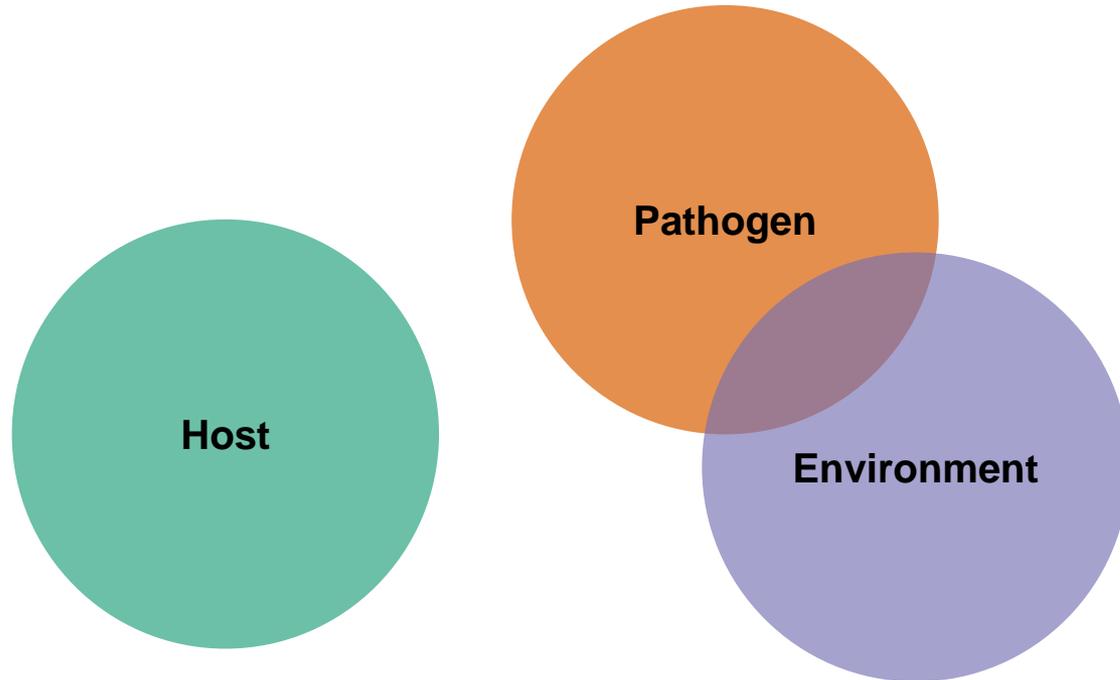

“Essentially, all models are wrong, but some are useful.”

–G. E. P. Box

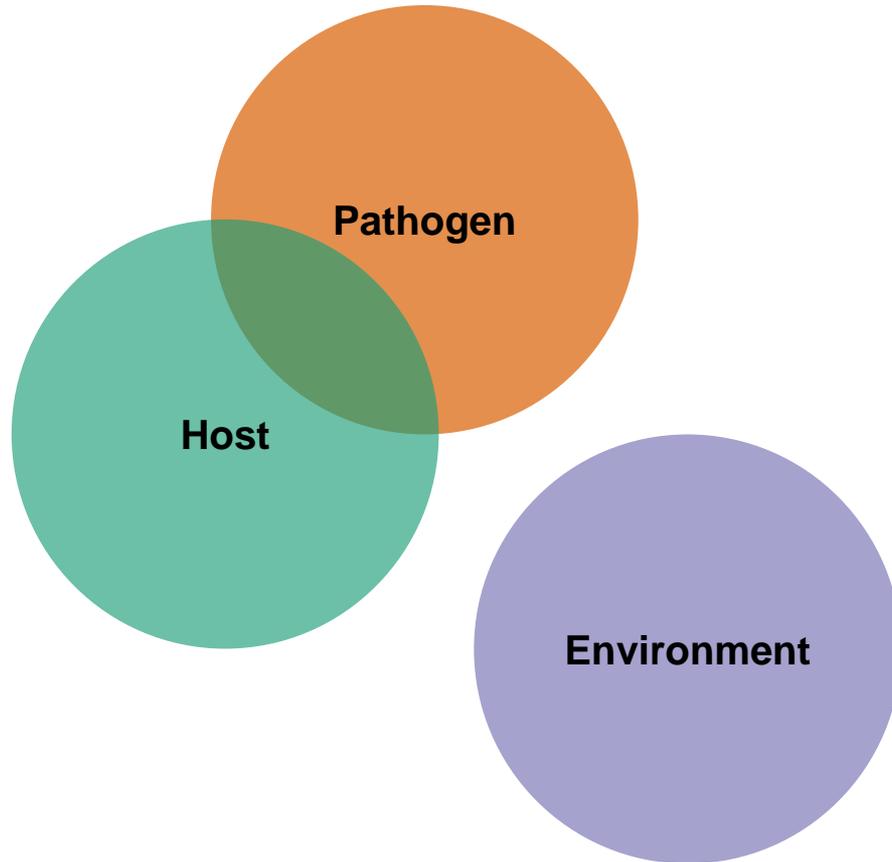

Plant Disease Triangle

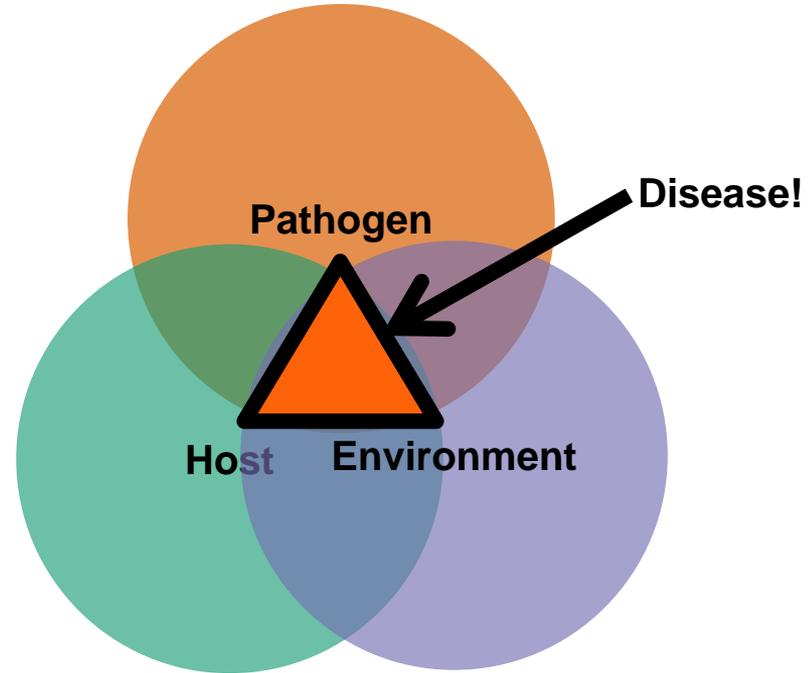

Plant Disease Triangle

Plant Disease Triangle

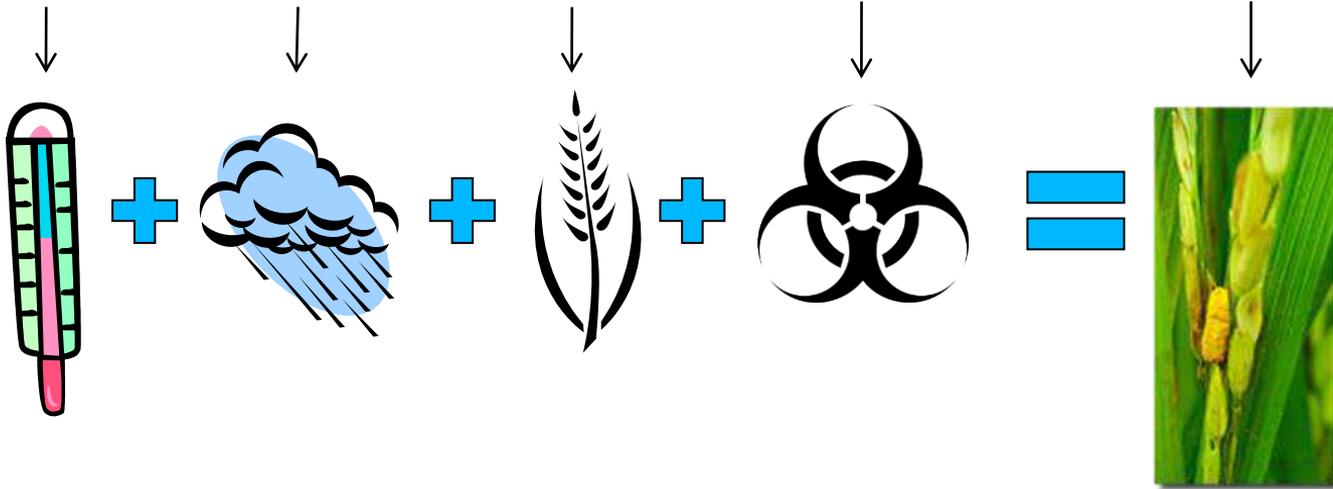

Plant Disease Triangle

Reality. Simplified.

Crop Health Models

Environment + Host + Pathogen = Disease

Why use models?

- Decision support tools
- Simplification
- Faster

Tactical models

Simulation modelling

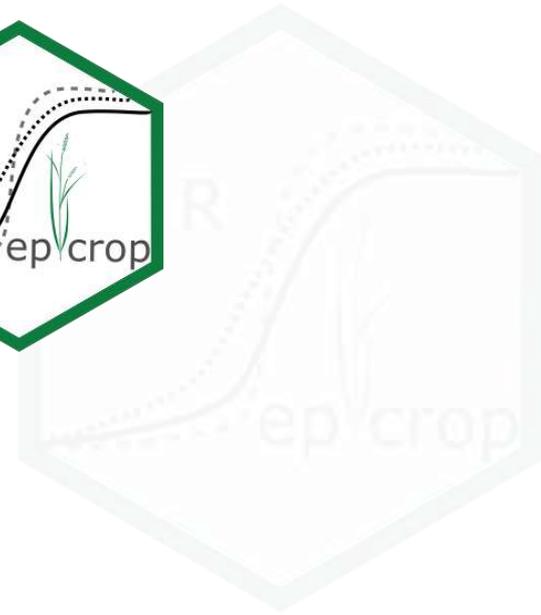

EPIRICE

A simple model of rice diseases

epicrop and EPIRICE, who's who?

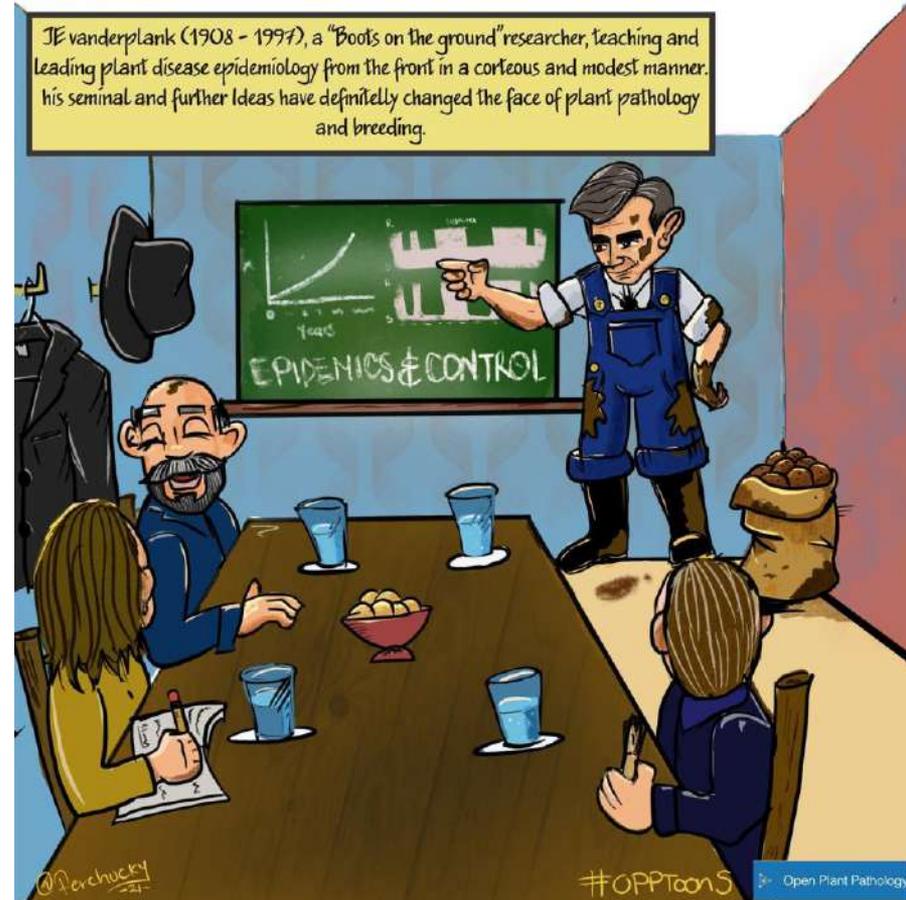

epicrop (Sparks 2021) is a fork of the ***cropsim*** R package (Hijmans *et al.* 2017) and was designed to make using the **EPIRICE** model (Savary *et al.* 2012) easier to use for rice disease modelling using freely available weather data from NASA and CHC UC Santa Barbara.

What's a SEIR Model?

SEIR (Susceptible-> Exposed-> Infectious->Removed) model

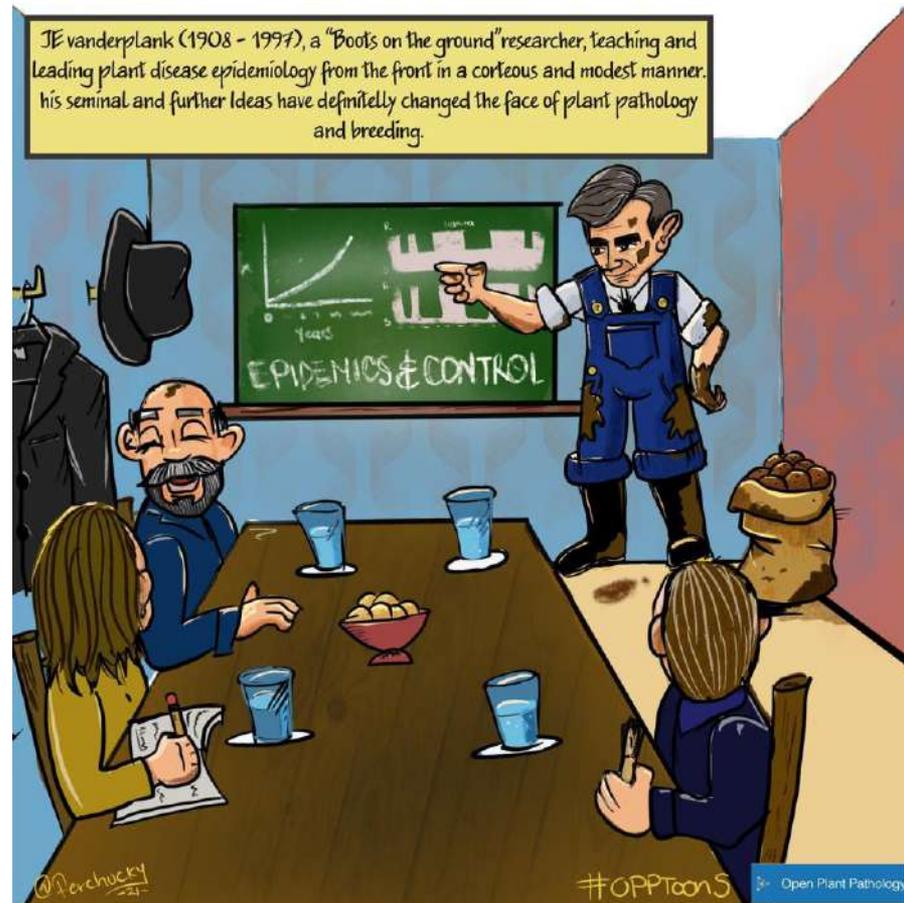

- Van der Plank (1963)
- Zadoks (1971)
- Madden (2006)

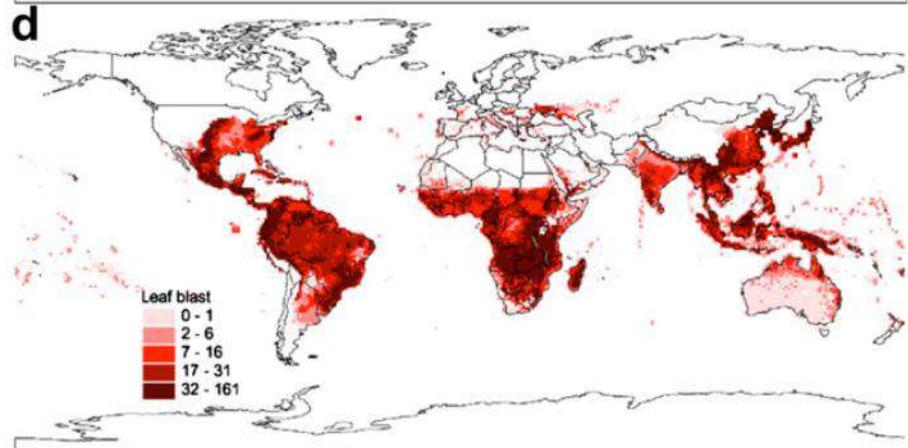

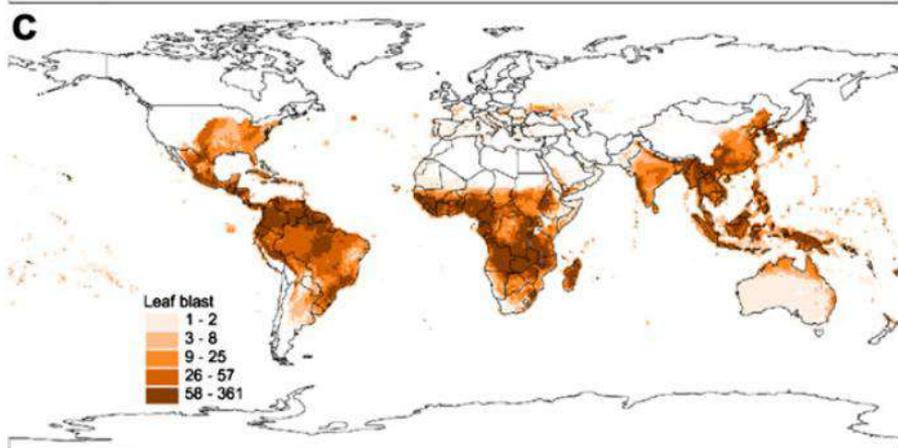

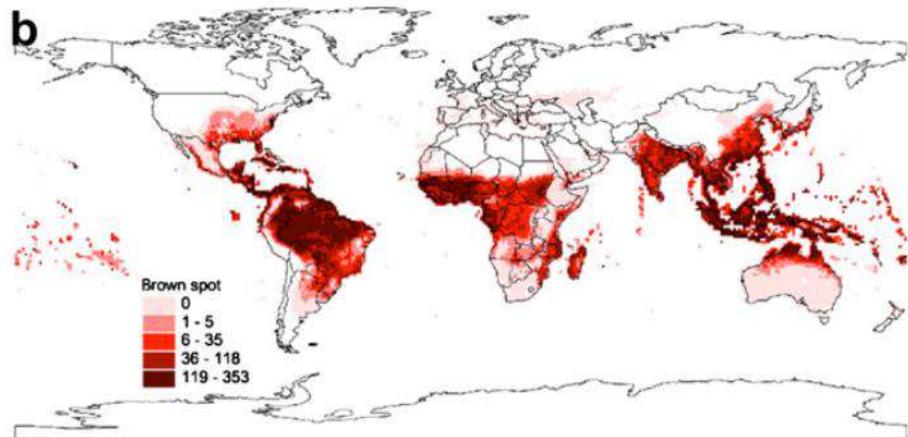

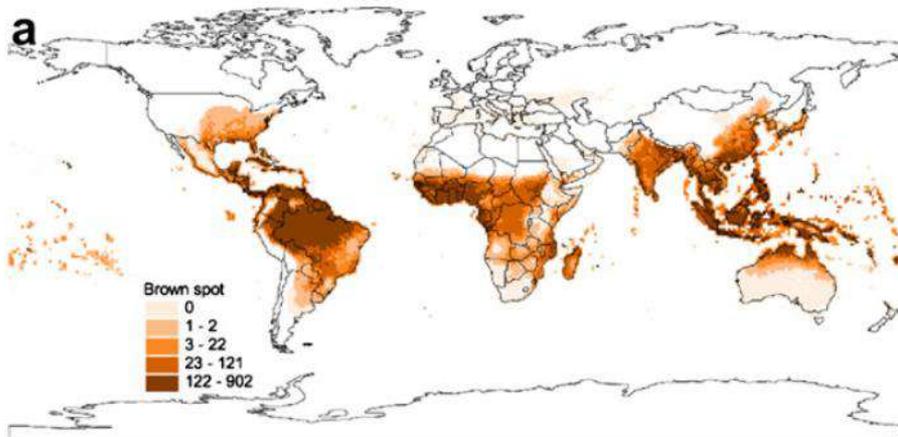

What's a SEIR Model?

SEIR state variables in **EPIRICE**

- Healthy (H)
- Latent (L)
- Infectious (I)
- Post-infectious (P)

Acronym	Variable type	Variable meaning	Dimension
H	State variable	Number of healthy sites	[NSites]
L	State variable	Number of latent sites	[NSites]
I	State variable	Number of infectious sites	[NSites]
P	State variable	Number of post-infectious (removed) sites	[NSites]
a	Parameter	Aggregation coefficient	[-]
i	Parameter	Duration of infectious period	[day]
p	Parameter	Duration of latent period	[day]
RcOpt	Parameter	Potential basic infection rate corrected for removals	[NSites $\text{NSites}^{-1}\text{day}^{-1}$]
RcA	Parameter	Modifier for R_c for crop age	[-]
RcT	Parameter	Modifier for R_c for temperature	[-]
RcW	Parameter	Modifier for R_c for wetness	[-]
RRG	Parameter	Relative rate of growth	[NSites $\text{NSites}^{-1}\text{day}^{-1}$]
RRS	Parameter	Relative rate of senescence	[NSites $\text{NSites}^{-1}\text{day}^{-1}$]
RP	Parameter	Rate of senescence induced by disease	[NSites day^{-1}]
S_x	Parameter	Maximum number of sites	[NSites]
R_c	Variable	Basic infection rate corrected for removals	[NSites $\text{NSites}^{-1}\text{day}^{-1}$]
TS	Variable	Total number of sites	[NSites]

Table 1 from Savary *et al.* 2012

System's attribute	Parameter ^a	Disease				
		Leaf blast	Brown spot	Bacterial blight	Sheath blight	Tungro
Sites	Site size	45 mm ² of a leaf	10 mm ² of a leaf	1 leaf	1 tiller	1 plant
	Sx	30,000	100,000	3200	800	100
	References ^b	(1)	(2)	(3,4)	(3,4)	(5)
Crop growth	RRG	0.1	0.1	0.1	0.2	0
	RRS	0.01	0.01	0.01	0.005	0
	References ^b	(3,4,6)	(3,4,6)	(3,4,6)	(3,4)	(7)
Epidemic onset	Date	15 DACE	20 DACE	20 DACE	30 DACE	25 DACE
	References ^b	(8)	(9)	(10)	(3)	(7)
Residence times	<i>p</i>	5	6	5	3	6
	<i>i</i>	20	19	30	120	120
	References ^b	(11,12)	(13,14)	(15)	(16)	(17)
Infection rate	<i>r_I</i>	0.28	0.19	0.25	0.23	0.10

Table 2 from Savary *et al.* 2012

epicrop

Modelling rice diseases. Simplified.

Installing *epicrop*

<https://github.com/adamhsparks/epicrop> (code)
<http://adamhsparks.github.io/epicrop/> (docs)

Installing *epicrop*

```
if (!require("remotes"))  
  install.packages("remotes")  
  
remotes::install_github("adamhsparks/epicrop"  
  build_vignettes =  
  TRUE)
```

Using *epicrop*

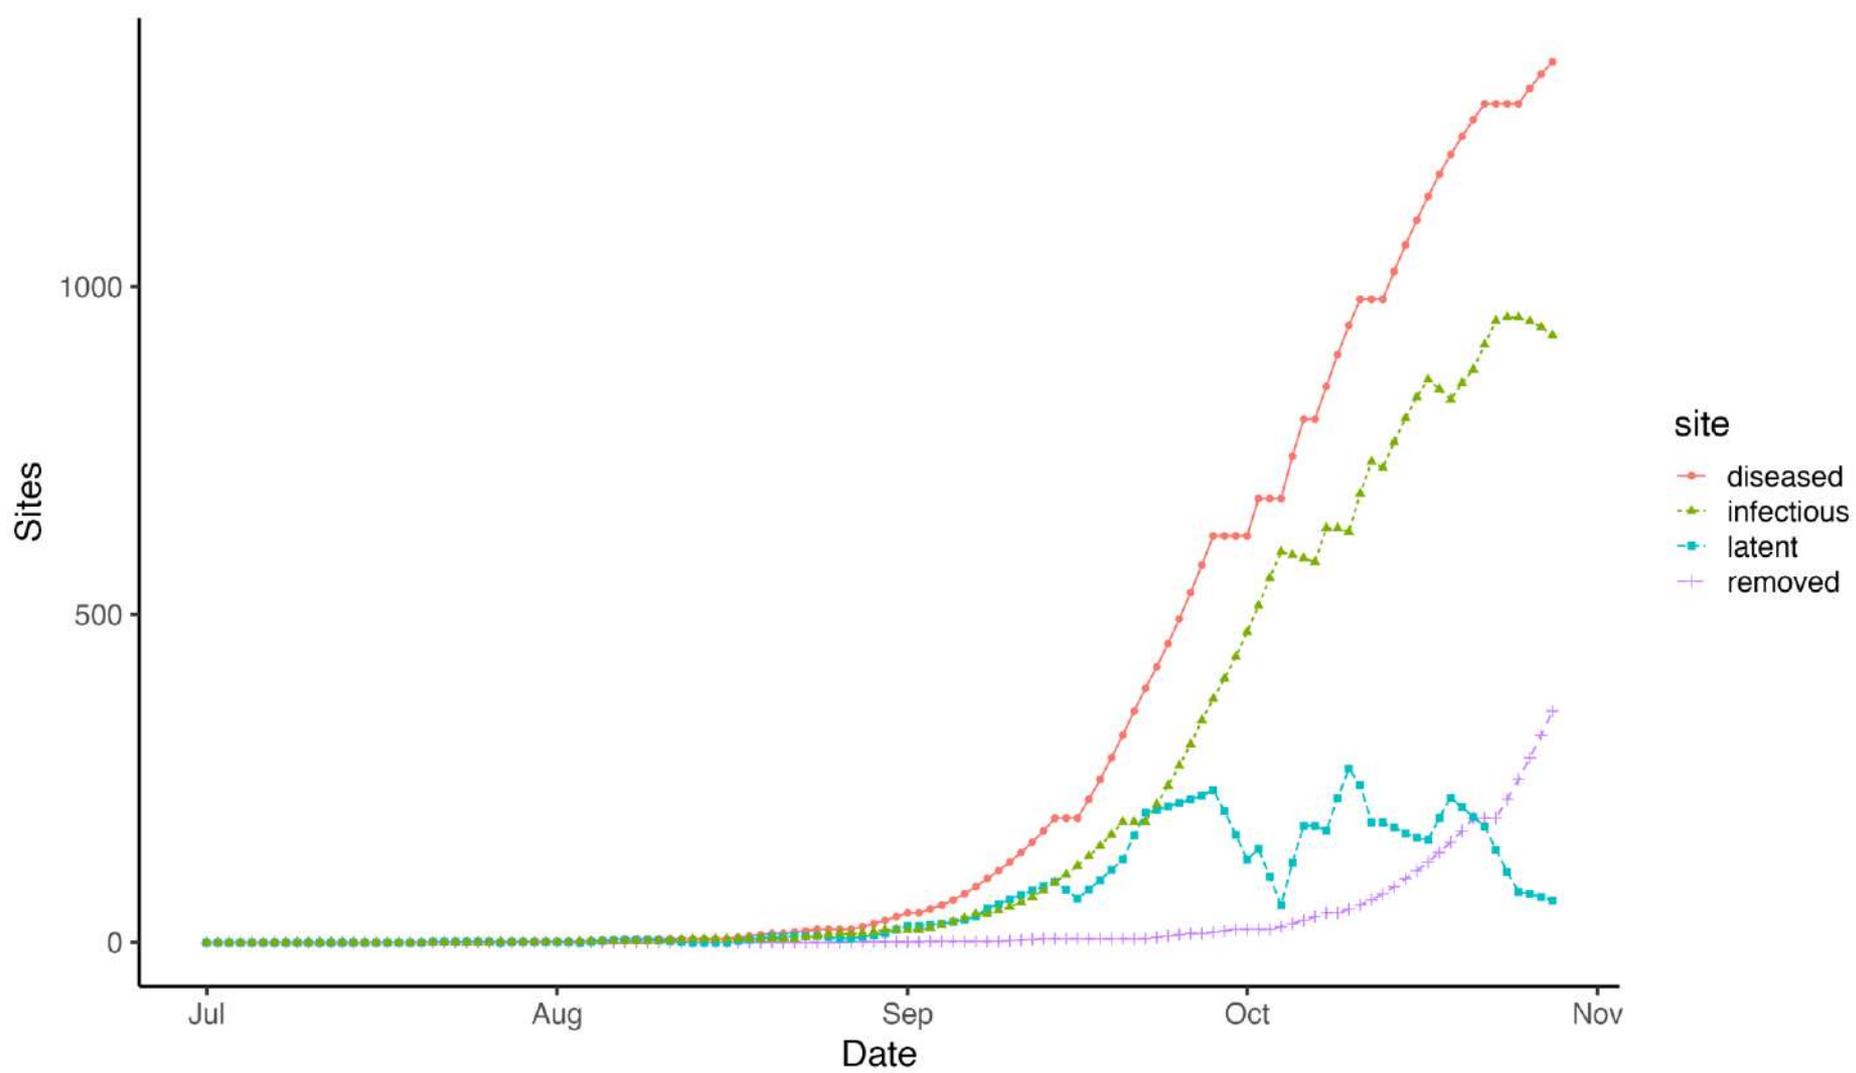

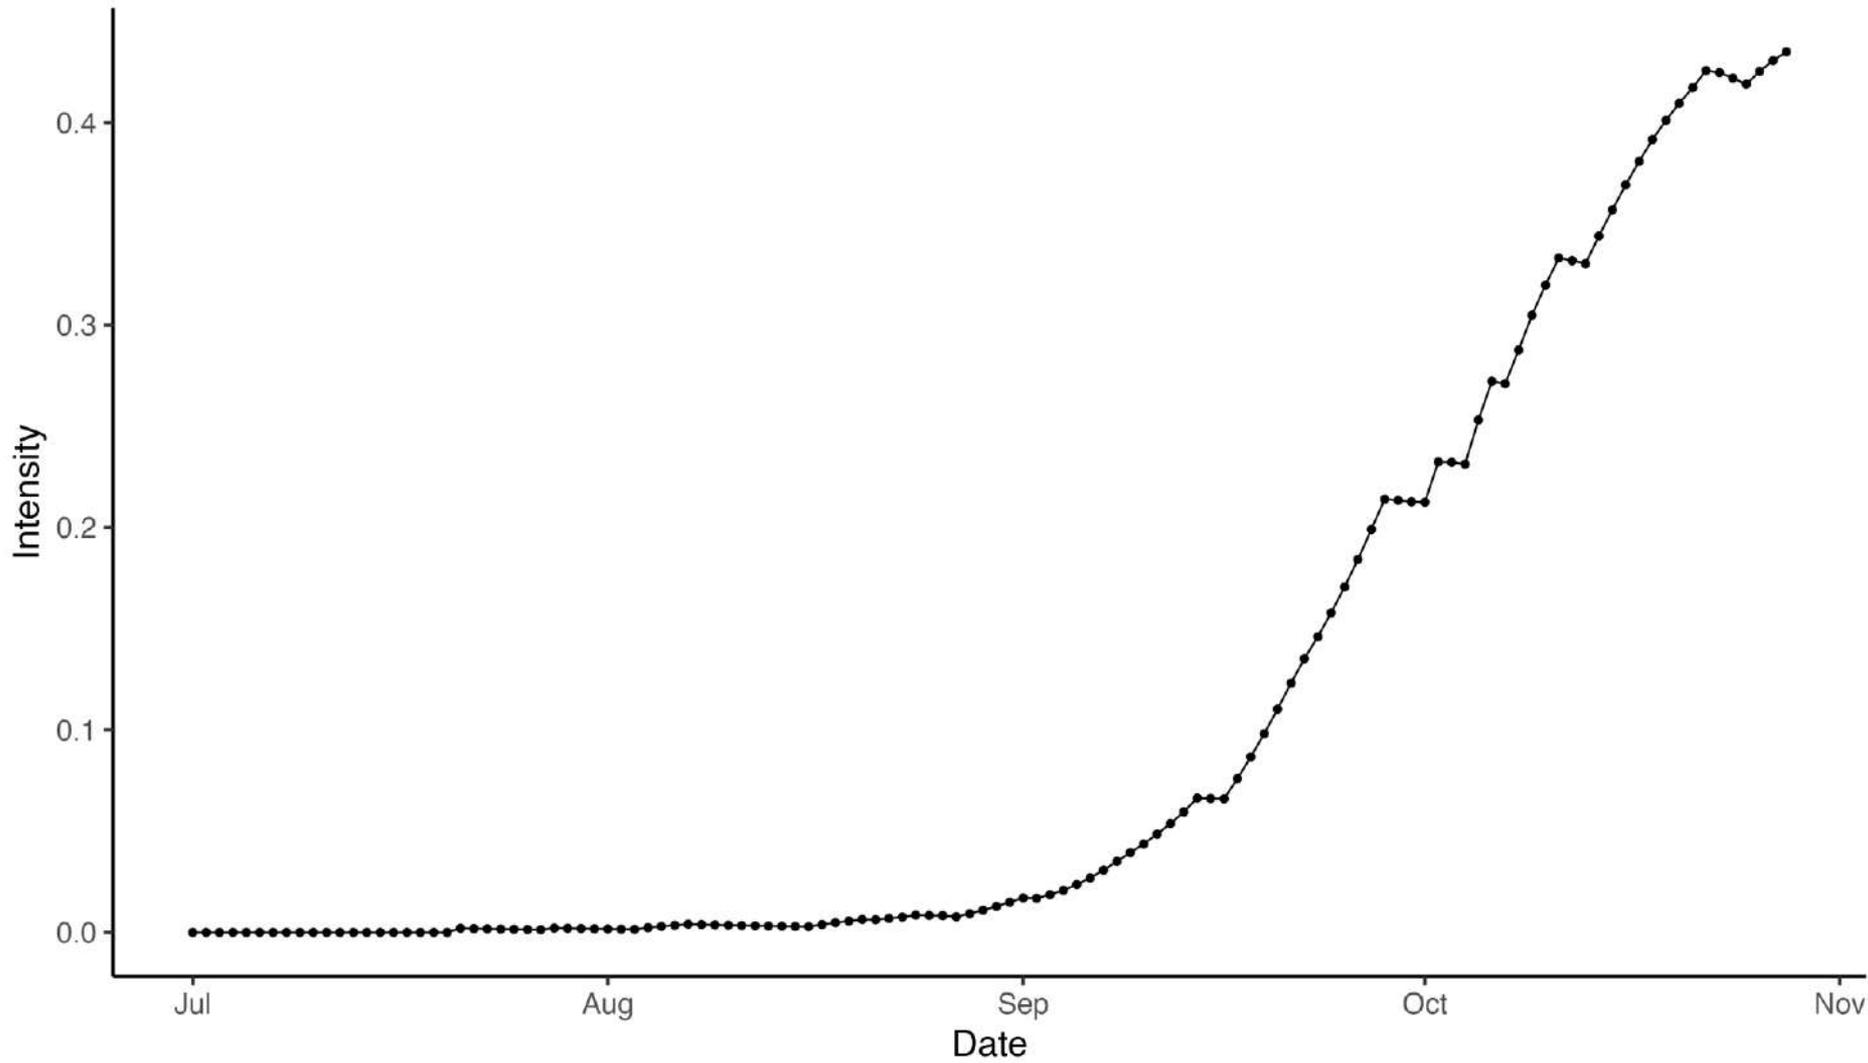

```
library("epicrop")  
vignette("epicrop")
```

Using *epicrop*

```
# Fetch weather for year 2000 season at the  
# IRRI Zeigler Experiment Station  
wth <- get_wth(  
  lonlat = c(121.25562, 14.6774),  
  dates = c("2000-01-01", "2000-12-31")  
)
```

Using *epicrop*
