---

## Presentation

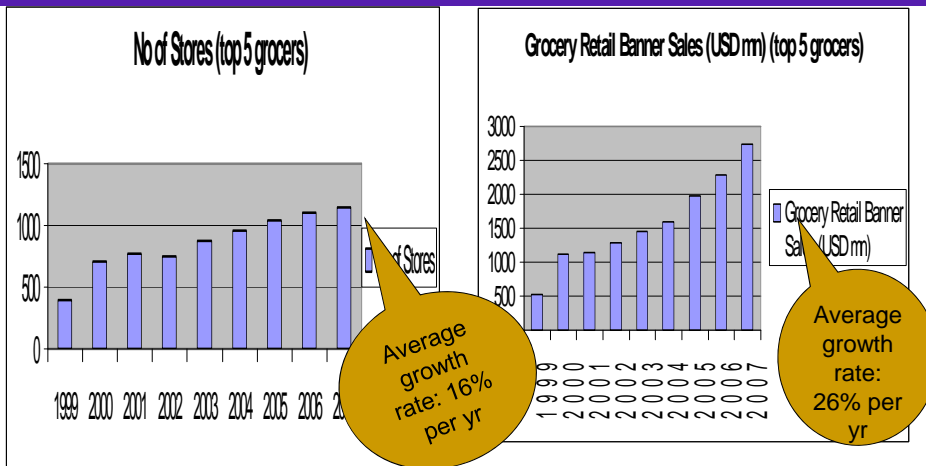

- Framework of analysis: participation of small scale producers in dynamic chains
  - Changing Agrifood system: some factors
  - Changing Cavendish banana chain: some factors
  - Competitive performance of selected agricultural products
  - Participation of small producers in the banana chain
  - Development Options to enhance participation
  - Conclusions
-

## Changing agri-food system & small producers: in or out?

## Changing Philippine Agrifood Markets: Some Trends

**Trend 1: Expanding High value markets (export and modern retail and fastfood chains)**

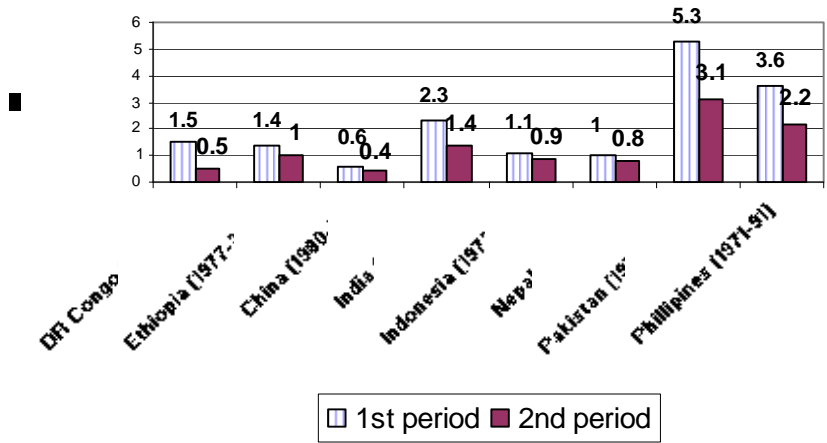

(Source: Planet retail 2008)

### Trend 4: Fragmenting farms in less developed countries

Avg farm size over time: The shrinking block

(source: Roy, 2006)

### Average Farm size: expanding block

Avg farm size: over time The expanding block

(source: Roy, 2006)

### Trend 5: Weak institutions/governance, infrastructure, labor productivity, innovation

## Opportunities and Challenges in Modernizing Agri-food system

### **Opportunities**

- Expanding modern/high value markets

### **Challenges**

- Fragmented production sector but concentrated buyers (eg processing and retail)-costly consolidation and possibility of market power
- Limited resources of small scale producers to respond to market opportunities
- Demanding market requirements: quality, volume and frequency
- Weak enabling environment-institutions/governance, labor efficiency, innovation logistics and infrastructure facilities

How about the cavendish banana  
industry?

## Markets and firms are expanding

- 1) Firms expanding: a) Sumitomo – P5.5B - agro-industrial ecozone b) Dana Fresh Agri Development – P314.23 m – 250 ha plantation 2) new investors coming in – AgriNurture – investing in banana and organic fertilizer in the Philippines and China 3) market expansion-Vietnam, ME & Australia

The screenshot shows the Manila Bulletin website with several news articles. The main article is titled "Bahraini Firm Invests in Banana Farm" by Bernie Cahles-Magklat, dated September 30, 2010. It reports that a joint venture between Dana Fresh Agri-Development Inc. and a Bahraini firm is developing a 250-hectare Cavendish banana plantation in Sarangani province for export to the Middle East, Bahrain, Korea, and other Asian countries. Another article, "Philippines dominates banana market in Vietnam", notes that bananas from the Philippines are becoming popular in Vietnam due to their appearance and size. A third article, "It's now safe to import Philippine bananas to Australia", mentions that the Australian government has decided it is safe to import Cavendish bananas from the Philippines.

## Expansion of banana hectareage: opportunity for smallholder participation

The screenshot shows a blog post from Agriculture Philippines, dated Thursday, July 30, 2009. The title is "Arroyo Lifts Limit on Banana Plantation Hectareage". Below the title is a photograph of a banana plantation. The text below the photo states: "Davao City — Banana growers said big plantations could easily expand to 10,000 more hectares within the next 12 months following President".

# Challenges

**Banning Aerial Spray: farm size shrinking by 20%, lowering volume, increasing cost per box?**

Cavendish Banana Production and Export Industry in The Philippines is Shaken by Banning of Aerial Spraying

Published by otikerotsen on February 12, 2010 in Asia

Philippine Cavendish Banana Production and Exporting Industry is shaken by banning of aerial spray. The member of the pro aerial sector consisting of agrarian reform beneficiaries of the government are in great lament because of this. The

**Rain of death**  
A Briefer on the Ban Aerial Spraying Campaign

Aerial spraying is a way of applying pesticides to agricultural crops using aircrafts. In the Philippines, export Cavendish banana plantations has been using this practice to kill the Sigatoka fungus since the 1970s. Aerial spraying allows the plantations to spray more of their bananas in lesser time.

Aerial spraying, however, showers down poison indiscriminately from the skies hitting not only the target pest but also anything human or non-human within the range of the toxic fallout. Studies have shown that the toxic drift reaches 3.2 kilometers on the average.

# Polevaulting

**64 YEARS**  
SINCE 1946

**MINDANAO TIMES**  
ETERNAL VIGILANCE IS THE PRICE OF FREEDOM

**Banana firm complains of 'pole-vaulting' anew**

Written by Francisco Carmona  
Thursday, 29 July 2010

SAIWAI companies have complained again about "pole-vaulting" in the industry with one of them, the Lapar-owned Lapar Day Foods Corp., already filing a case against one of its growers.

Herman P. Geronimo, head of the company's Human Resources and Shared Services Division, said the pole-vaulting that has hit the company since June 22 has been "large scale and unique," unlike in the past when "consolidators" were only buying when the season for bananas was indicated that prices were high.

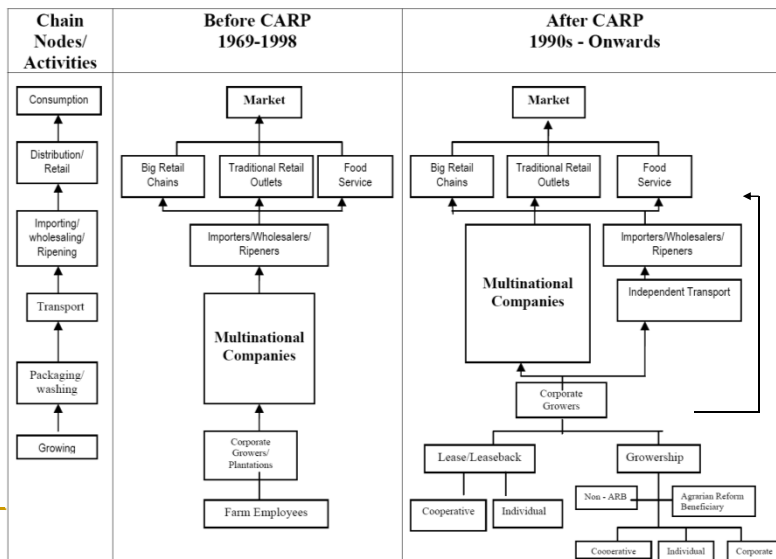

"Obviously, this is (the work of a mercenary (consolidator)," Mr. Geronimo said, pointing out that the incident of pole-vaulting was "orchestrated and a targeted activity."

The problem "has become an industry concern," he said. Another official of another company confirmed that pole-vaulting has become prevalent in the industry, unlike in the past when volume was still negligible. "In the past it was just intermittent," Geronimo said.

## Options for Development: Enhancing participation linkages with smallholders

- Getting the bottomline equation right!
- Linkages strengthen as actors benefit
- Profit/Net Benefit=Sales-Cost=  
Price x Quantity-Cost
- Plus the enabling/business environment to make the equation right!

### Option 1: improve price

Growers do not have control over price except through quality and product differentiation

| Node                   | Price transmission elasticity |
|------------------------|-------------------------------|
| Philippine-Japan       | 0.94                          |
| Philippine-Middle East | 0.84                          |
| Philippine Korea       | 0.72                          |

| Quality Differentiation                                   | Product Differentiation  |
|---|--|
| Class A is \$1 or 48% more expensive than Class B         | Price of organic banana is at least 30% higher than non-organic banana |
| Class A is \$2 or 255% more expensive than class C banana | Price per kilogram of cluster packs is about 6% higher than regular    |

## Option 2: Improve productivity

| Items                            | Cost and income per hectare by number of boxes (Pesos) |                |                |                | % to total cost by number of boxes |      |      |      |
|----------------------------------|--|----------------|----------------|----------------|------------------------------------|------|------|------|
|                                  | 3000   | 3500           | 4000           | 4500           | 3000                               | 3500 | 4000 | 4500 |
| Total Pre-Cut Cost (PhP)         | 244,914  | 244,914        | 244,914        | 244,914        | 64                                 | 61   | 58   | 55   |
| Total Direct Cost of Fruit (PhP) | 385,267  | 404,241        | 423,214        | 442,188        | 100                                | 100  | 100  | 100  |
| Cost per box (PhP)               | 128  | 116            | 106            | 98             |                                    |      |      |      |
| Cost per box in USD (1:48PhP)    | 2.67   | 2.42           | 2.21           | 2.04           |                                    |      |      |      |
| Net income per hectare           | <b>66,000</b>  | <b>122,000</b> | <b>178,000</b> | <b>234,000</b> |                                    |      |      |      |

Source: key informant interview (2008)

## Income per hectare of grower under cooperative individual and non-individual farming

| Item                       | Cooperative | Individual Farming System | % Difference |
|----------------------------|-------------|---------------------------|--------------|
| Total Gross Sales          | 351,950     | 309,520.37                | (13.71)      |
| Dividends from Cooperative | 654.78      | 5,189.99                  | 87.55        |
| Salary                     | 76169.16    | -                         | (100.00)     |
| Total Gross Income         | 428,773.78  | 314,710.36                |              |
| Costs                      |             |                           |              |
| Operating cost Cooperative | 86,225      |                           |              |
| Total Production Cost      | 265,147     |                           |              |
| Total Cost                 | 351,372     | 220,311.88                | (59.49)      |
| Total Net Income           | 77,401.78   | 94,398.48                 | 18.00        |

Source: key informant interview (2008)

## Option 3: Reduce cost of production & marketing

| Cost*  | 2005          |                | 2008          |                | Growth rate (2005-08) |           |
|--|---------------|----------------|---------------|----------------|-----------------------|-----------|
|  | Cost/ hectare | % to total     | Cost/ Hectare | % to total     |                       |           |
| Labor (includes weeding, pruning, harvesting, packing, and other labor cost) | 118,300       | 37             | 188,512       | 39             | 59                    |           |
| Fertilizers  | 25,500        | 8              | 69,747        | 14             | 174                   |           |
| Pests and disease control chemicals  | 89,410        | 28             | 96,324        | 20             | 8                     |           |
| Propping materials   | 15,848        | 5              | 21,208        | 4              | 34                    |           |
| Bagging materials  | 19,500        | 6              | 30,517        | 6              | 57                    |           |
| Fuel, oil and lubricants   | 15,165        | 5              | 24,264        | 5              | 60                    |           |
| Other cost (eg depreciation)   | 27,000        | 8              | 29,700        | 6              | 10                    |           |
| Overhead   | 10,000        | 3              | 16,511        | 3              | 65                    |           |
| Source: Key informant interview 2008   | <b>total</b>  | <b>320,724</b> | <b>100</b>    | <b>476,783</b> | <b>100</b>            | <b>49</b> |

## Production and Marketing costs (2009 estimate)

| Costs   | % Share |
|---|---------|
| Fruit production cost                             | 37      |
| Costs to port, loading, documents, administration | 4       |
| Carton, packing materials, and palletization      | 17      |
| Freight rates per box                             | 22      |
| Container rates                                   | 21      |
| Total (cost and freight rates)                    | 100     |

Source: confidential

## Option 4: Address policy and institutional issues

- CARP
  - inefficiencies due to the loss of economies of scale that add costs to production estimated at up to 30%
  - costs include consolidation costs and lower labor efficiency among others
  - Access to credit (low collateral value due to policy constraints)
  - Small holder farmer yields – lower by about 20 per cent compared to well managed larger farms of 200 - 250 hectares
- Aerial spray- decrease area by 20%
- polevaulting- accreditation of farms

## Why cavendish banana excelled relative to other agricultural products?

- Better in managing the bottomline equation right: Profit=Sales-Cost= Price x Quantity-Cost through:
  - Influencing price through product quality and differentiation
  - Improving productivity
  - Managing costs
  - Enhancing efficiency: economies of scale, vertical integration, contractual arrangements
  - Fostering a conducive enabling/business environment to make the equation right by being organized
  - **Cluster/value network development is largely private sector driven – vertical and horizontal relationships of chain actors are strong, actors address common challenges and opportunities, “coopetition” and continuous are encouraged/promoted improvement/innovation**

### Reduce cost of production & marketing

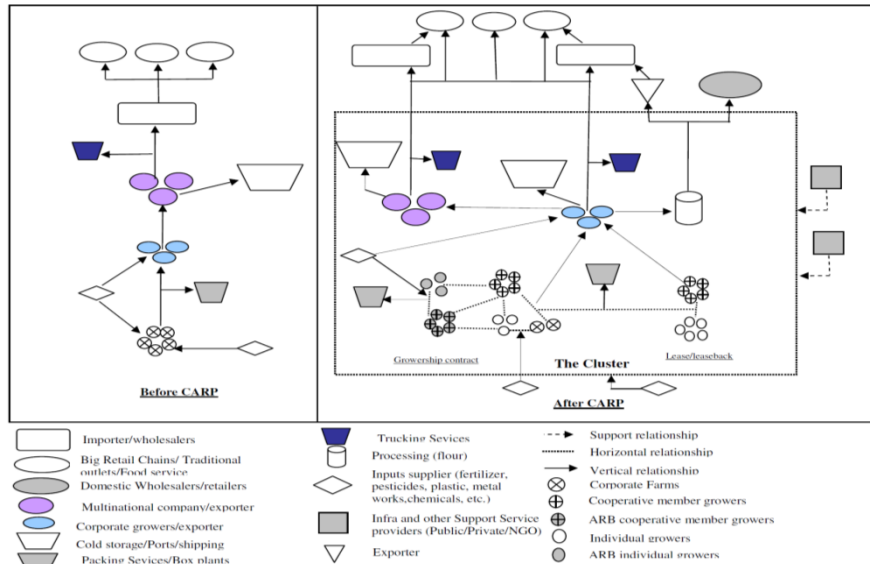

Average Costs & Returns of Selected Fruits 1998-2008  
(Mango, Durian, Calamansi, Papaya, Pineapple)

Average Cost & Returns of Selected Vegetables 1998-2008  
(Ampalaya, Carrots, Cabbage, Eggplant, Potato, Tomato)

Degree of competitiveness of an industry is significantly explained by the degree of linkages eg production-processing linkage

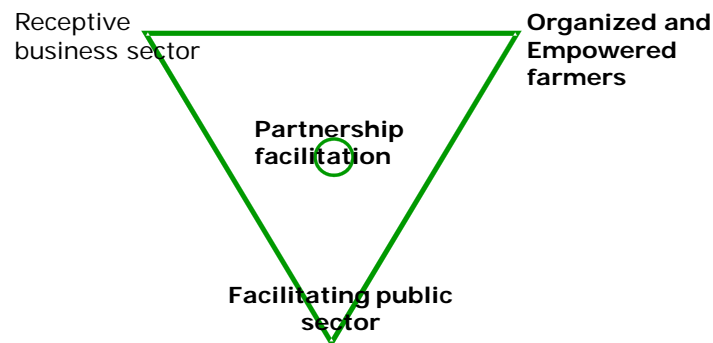

Source: Agro-industry cluster study, World Bank 2011

Economies of scale (firm size) affects competitiveness which can be partly addressed through clustering

| Industry   | RANK (Competitiveness index ) by size of Employment (census 2006) |                        |
|--|---|------------------------|
|  | Less than 20 employees  | More than 20 employees |
| Hog farming                                      | 1   | 3                      |
| Growing of banana                                | 7   | 1                      |
| Growing of sugarcane, muscovado                  | 5   | 2                      |
| Livestock farming (except hog)                   | 12  | 8                      |
| Growing of vegetables, roots and tuber crops     | 9   | 7                      |
| Forestry, logging and related service activities | 11  | 11                     |
| Growing of coconut and others                    | 8   | 12                     |

(Agro-industry cluster study, World Bank 2011)

**Foundation of success: linking small farmers to high value markets (40 case studies in more than 20 countries)**

**Examples of clusters at smaller scale: calamansi & Norminveggies**

Source: RMP 2008 (Peppelenbos, et al)

**Conclusions**

- Changing agrifood system in the Philippines-creating opportunities and challenges in the chain for small scale producers
- Cavendish banana is competitive but there is a need to make participation of small scale producers more profitable/equitable
- This can be done through an integrated package of assistance to meet market requirements- to include improving productivity, quality and lowering production and marketing costs, credit, infrastructure and policy support
- Integrated development intervention will be more effective if implemented within a cluster/value chain framework (efficient delivery of service to meet market requirements) where the private sector is the prime mover
